ABSTRACT:

Software is down-loaded from a central station of a wireless
telecommunications system to a remote subscriber station for
configuring the remote subscriber station to permit wireless
connection of user telecommunications equipment at the remote
subscriber station to the central station. A multi-layer down-load
protocol includes a number of independent protocol layers, preferably
operating a master-slave configuration. Each layer controls respective
sequence numbers to ensure system integrity. Control software is
arranged with a device independent boot-strap and a set of device
specific external service parameters to provide portability.
